

THE IMPORTANT ROLE OF REGULATION TO SCALE-UP **RE DEVELOPMENT IN AFRICA TO ACHIEVE SDGS**: LESSONS FROM NORTH AFRICA AND MIDDLE EAST

Dr. Maged Mahmoud,

Technical Director, Lead Renewable Energy Advisor, Regional Center for Renewable Energy and Energy Efficiency (RCREEE) maged.mahmoud@rcreee.org

19 September, 2023 10:00 - 11: 00 (New York Time), 2:00 - 3:00 GMT

AREI Events on the Margin of The UNITED NATIONS GENERAL ASSEMBLY and AREI BOARD of DIRECTOR

RCREEE - Who we are

"We, the Regional Center for Renewable Energy and Energy Efficiency, are the strategic partner for the Arab countries driving energy transition for the prosperity of all our people."

Intergovernmental Organization with 17 Member States

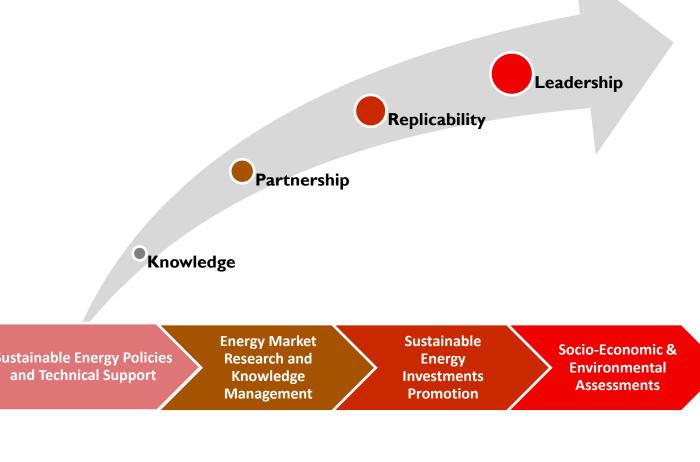

A leader in clean energy policy dialogues, strategies, technologies, investments promotion, and capacity development

The first regional renewable energy and energy efficiency center across the world

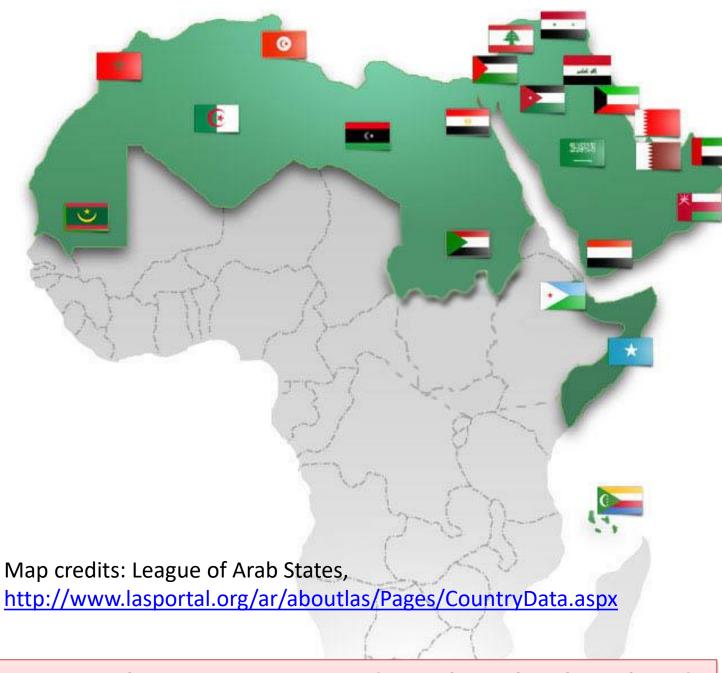

Secretariat in Cairo, Egypt with regional antennas and a pool of short-term experts

Work in the Pan-Arab Region... know how to navigate your way

RCREEE.

Energy in The SEMC/Arab Region

Some Arab countries are under colossal political and economic challenges that are exacerbated by the Covid-19 pandemic.

- 437 million inhabitants (5.6% of world population)
- 90% of its territories are in arid, semi-arid and dry sub-humid zone
- 55% of oil reserves and 24% of gas reserves worldwide!
- 6.3% annual electricity demand growth (15 years average)
- 4.9% annual primary energy growth (15 years average)
- 4.5% annual GDP growth (15 years average)
- 3% annual population growth
- 3% of the region GDP are required to keep up with the annual electricity investments needed to meet the demand
- 1.9% expected annual growth of primary energy demand in the region through 2035
- 55 million people receiving humanitarian aid
- 74 million people are of high risk of Covid-19 due to lack of basic handwashing facilities

Regional Center for Renewable Energy and Energy Efficiency المركز الإقليمي للطاقة المتجددة وكفاءة الطاقة RE of Increasing the share

The share of RE will reach 12.4% of the electricity generated, and its share in the total final energy will reach 2.8%.

efficiency energy Improve

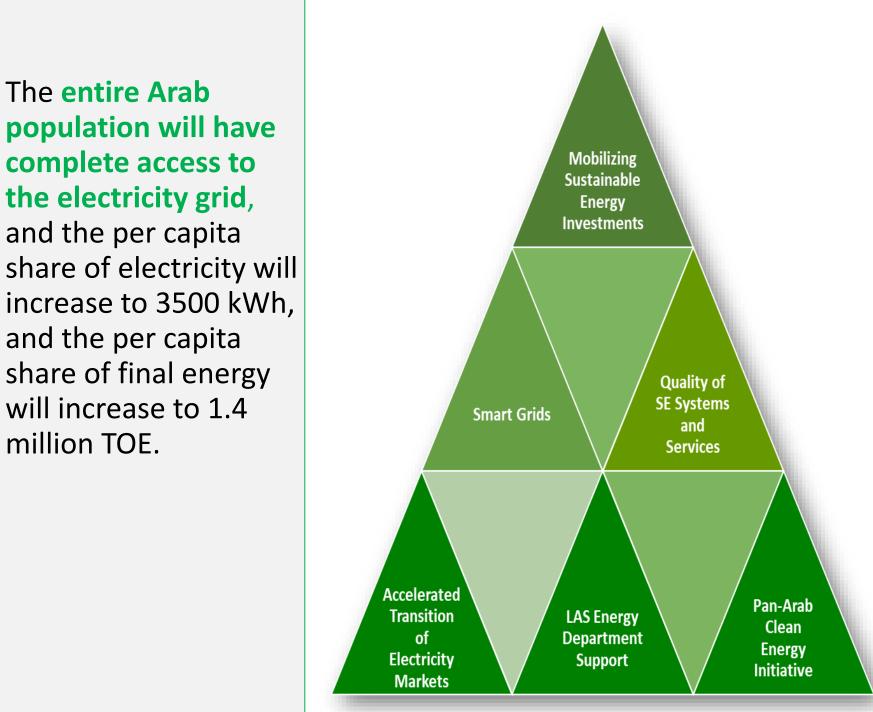

The primary energy intensity will improve more than 30%

compared to 2014 levels from 0.29 to 0.22 kOE/ USD, and the average **efficiency** of the power plants will increase

significantly from 36% to 49%, while the electricity transmission and distribution losses will decrease from 16.5 % to 9%.

services access to modern energy Ensuring

population will have complete access to the electricity grid, and the per capita share of electricity will increase to 3500 kWh, and the per capita share of final energy will increase to 1.4 million TOE.

Regional Areas of Action

Regional and National Policy Making Process

ARAB FUTURE ENERGY INDEX[™] (AFEX[™])

- The Arab Future Energy IndexTM (AFEX) is the first native Arab • index dedicated to monitoring and analyzing sustainable energy competitiveness and governance in the region. Since its launch in 2013, AFEX [™] became a policy assessment and benchmarking tool.
- It offers both quantitative and qualitative analysis for key renewable energy and energy efficiency market dimensions.
- 20 Arab Countries are ranked under more than 30 indicators that illustrate key energy market aspects including policies, institutional and technical capacities, strategies, socioeconomic data and investments.

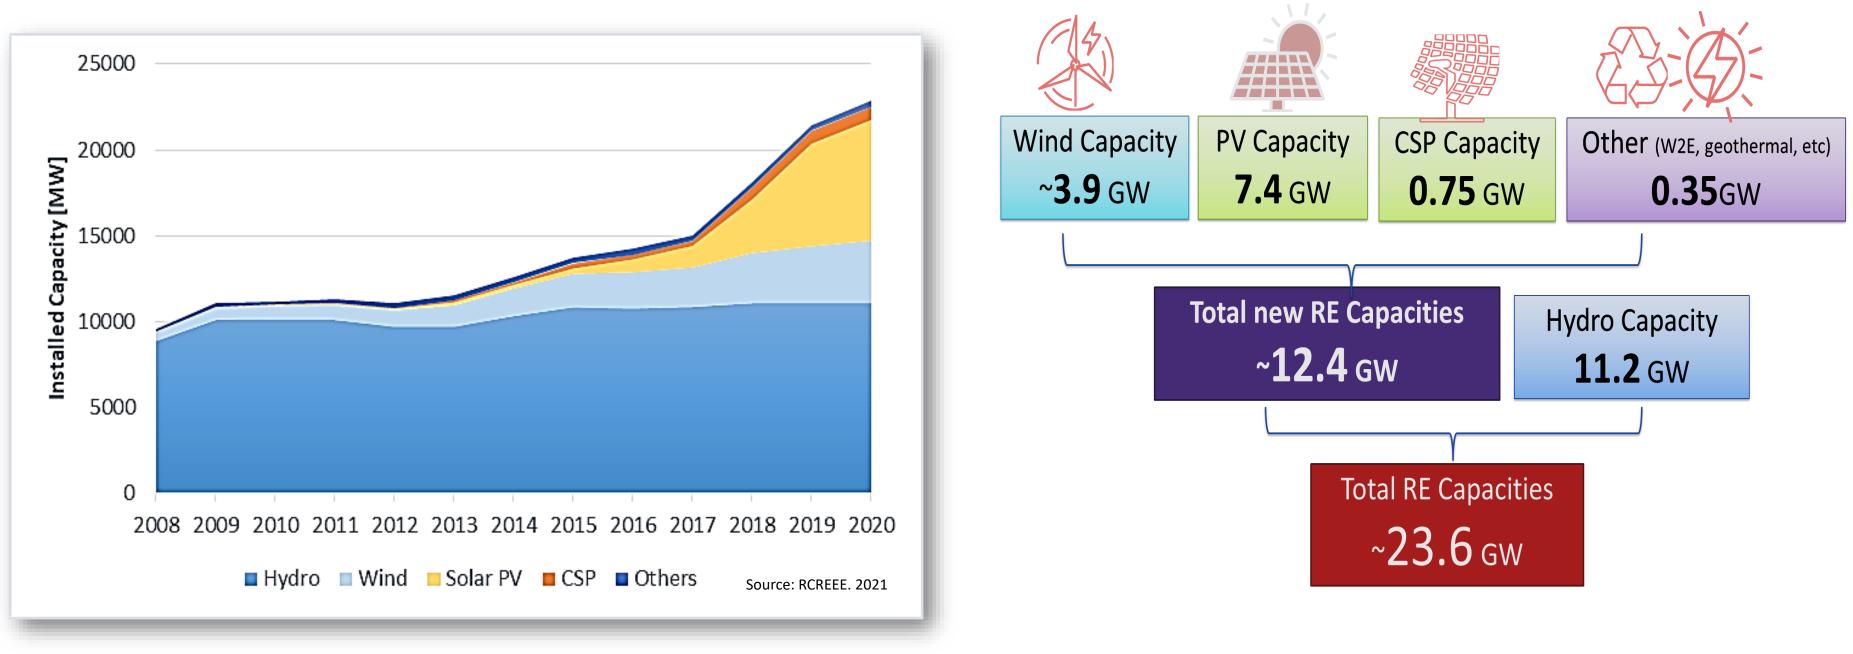

For the first time, AFEX 2023 will cover the 3 pillars of sustainable energy in one publication; Renewable Energy and Energy Efficiency and Energy Efficiency.

RE Installed Capacities

RE in the Arab Region: Operational Capacities Growth 2008-2020 [RCREEE, 2021]

RE in the Arab Region: Operational Capacities as of Dec. 2020 [RCREEE, 2022]

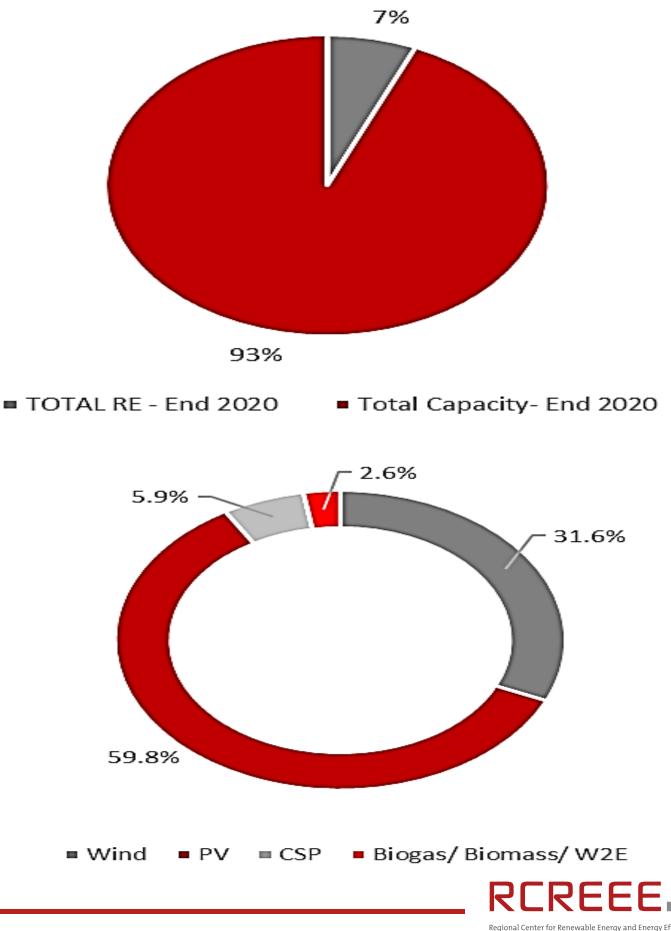

Regional Center for Renewable Energy and Energy Efficiency المركز الإقليمي للطاقة المتجددة وكفاءة الطاقة

RE Share

- □ The RE share reached approximately 7% in installed capacities.
- The dominated technology is still photovoltaic followed by wind energy; ~60% and 32% respectively (without accounting hydro power capacity).
- Hydro power has the largest installed capacity with approximate capacity of 11.1 GW. Other technologies combined capacity has surpassed the installed hydropower capacity for the first time in 2020.
- □ The installed capacity by 2020 is 12.4 GW, compared to the 7.2 GW in 2018. Around 5 GW were added in 2 years.
- PV capacity increased from 3.2GW by the end of 2018 to 7.4GW by the end of 2020.

Share of RE in Installed Capacity

co are the only countries with installed capacity

resents 49.1% and 65.4% of the RE energy portfolio ower) for Egypt and Morocco respectively nat al-Jandal wind farm in Saudi Arabia was grid in 2021

Solar Energy

- UAE leads Arab countries when it comes to the PV installed capacity (2.4GW). This represents 96% of the RE portfolio in UAE.
- Egypt holds the second place with installed capacity of 1.6GW representing also 48.7% of the total installed renewable energy.
- Jordan with a 1.54GW accounting for 74.7% of the total installed RE projects. •
- UAE, Egypt, and Jordan are the only countries having PV capacities more than 1 GW

- region.

• Only six countries have installed CSP technology.

• The highest installed capacity is in Morocco (530MW), representing 72% of the total regional capacity

• UAE holds the second place with 100MW. Saudi Arabia has 50MW.

Morocco, KSA, and UAE account for 93% of the regional CSP capacity in the

Requirements for RE Business Conducive Environment

Market size and profitability	Developed and transparent legal and regulatory system	Developed infrastructure
Ease of setting up a business / local licensing	Allowance for foreign ownership of property / business	Country's foreign investment track record
Capital Markets history – level of maturity	Bi/multilateral investment treaties in place	Available and competitively priced fuel /subsidy reforms

Stability and strength of local currency

Political and economic stability

Presence and readiness of solid financial institutions

Presence of high quality partners

Clear safety and environmental standards and labor laws

Liquidity/exit strategy

Enabling Frameworks

Legal Framework:

 Defines supporting policy, development schemes and responsibilities

Regulatory Framework:

 Details the parties commitments and technical and contractual requirements

Tariff Framework:

• Defines both tariff structure and values

Contractual Framework:

 Provides standard templates for contracts

Supplementary Frameworks:

 Contains supporting mechanisms including; resource assessment, technology transfer, soft finance funds,...etc.

Legal Framework

The Legal framework usually stands on a primary law. This may include:

Land Allocation Land allocation and usufruct rights)

Schemes for **building RE** plants (Statuary, Competitive Bidding, auctions, FiT, premium, net metering and merchant, etc.)

Grid responsibility for priority of dispatch and take or pay commitments in case if the grid is the off taker.)

Customer responsibilitie

S (Quota and its criteria, in case of adopting pulling market policy.)

Physical and soft incentives

i.e. tax credit, guarantee of origin certificate, trade marks, etc.)

Regulatory Framework

Installed Capacity

License the RE suppliers

Prequalification requirements for developers and small system integrators.

Public land allocation procedures

Dispute Resolution

Transmitting

Interconnection with the grid

Grid Code

Priority on Dispatching

TPA Right

Distribution and Trading

Quota for Consumers

Power Purchase requirements (including take or pay contracts in case the grid is the off-taker)

Settlements and GoC regulations

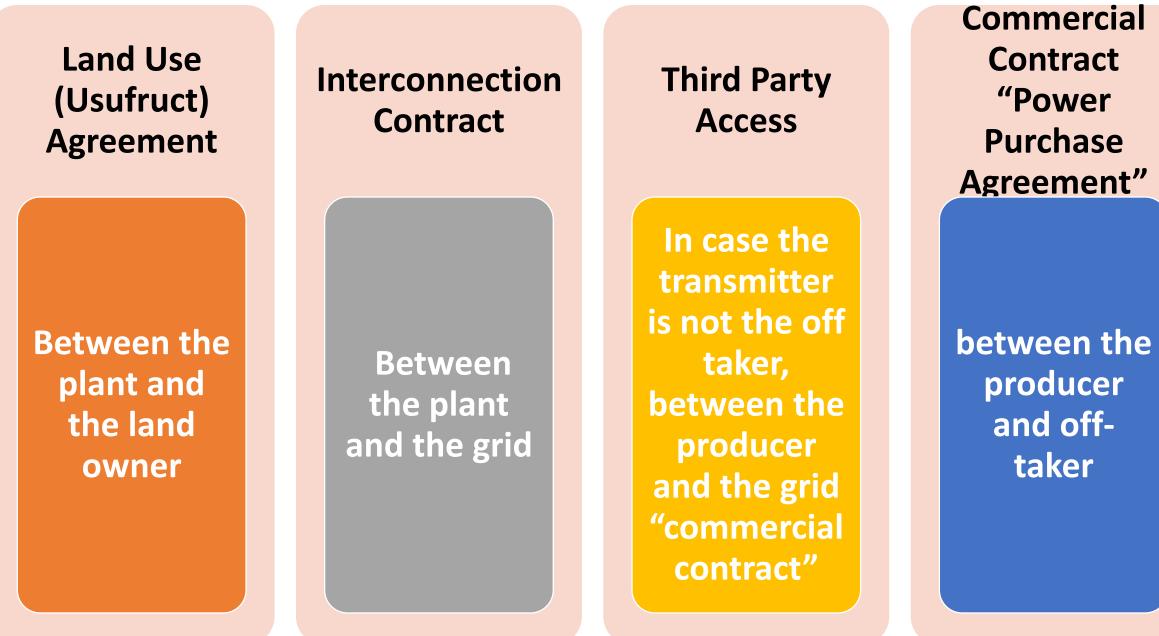

Issuance of Renewable certificates

Regional Center for Renewable Energy and Energy Efficiency لمركز الإقليمي للطاقة المتجددة وكفاءة الطاقة

Contractual Framework

This includes the following contracts

Feed Stock Supply Agreement

In case of biomass plants, between the feed stock supplier and the plant

Implementation Agreement

Cross linked agreement **between All Parties** involved in the project, the direct contract, energy banking, etc.

Supplementary Framework

Settlement and payment mechanism

Accreditation of system integrators for small projects

Land development and supply with infrastructure

One stop shop facility

Soft loans for small projects.

RE Projects under Construction

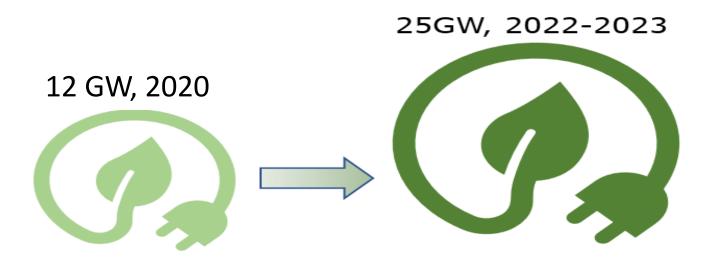

- More than **13GW** are under construction.
- region towards the transition to cleaner energy production.
- accounting for approximately **80% of the projects.**
- Wind projects come second with approximately 13%.
- (has more than 2GW of RE projects under development).

• A massive amount of RE capacities that shows the commitment of Arab

• **PV** technology is dominating the RE projects under construction

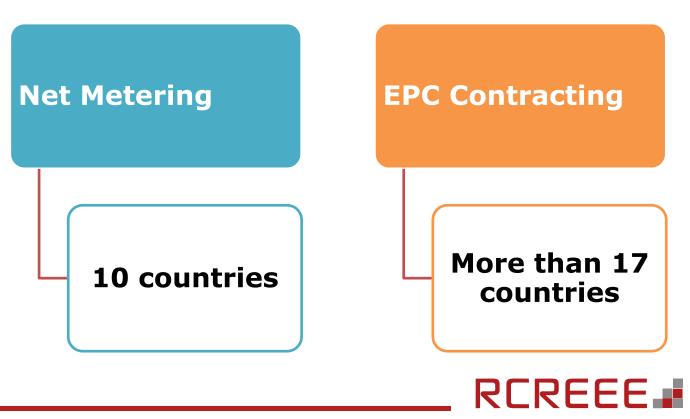

• Several countries with low installed RE capacities are developing large scale projects. For example, Qatar, that has around 50MW of renewable power is developing 800MW solar projects. It is the same case for Iraq

Policies for Mobilizing RE Investments in Arab Countries

- The preferred policy option for utility scale projects in the region is the public competitive bidding/auctions in many countries.
- Feed-in Tariffs (FiTs) are phasing out for utility scale projects
- The adoption of direct proposal submission proved to be successful for the development of large-scale RE projects in some countries.
- FiT and net metering are emerging for decentralized RE systems.

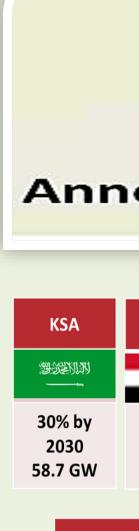

RE Targets

- Two Arab countries have 100% RE targets: Djibouti by 2035, and Morocco by 2050. Morocco also aims to achieve 52% of RE share by 2030.
- Two Arab countries adopted Net-Zero Emissions National Strategy; UAE and Saudi Arabia by 2050 and 2060, respectively.
- Algeria changed its target to be 15GW of photovoltaic technology by 2035.
- Jordan raised in the updated Energy Strategy for the Energy Sector 2020-2030 from 21% in 2020 to 31% share for renewables in total power generation capacity and 14% of the total energy mix by 2030.
- In terms of installed capacity, the highest are Saudi Arabia target of 58.7 GW by 2030 and Egypt target of 59.7 GW by 2035. These targets represent 30% and 42% share of national installed capacity respectively. The Egyptian RE strategy is under revision to be updated in order to reach more than 50% by 2035.

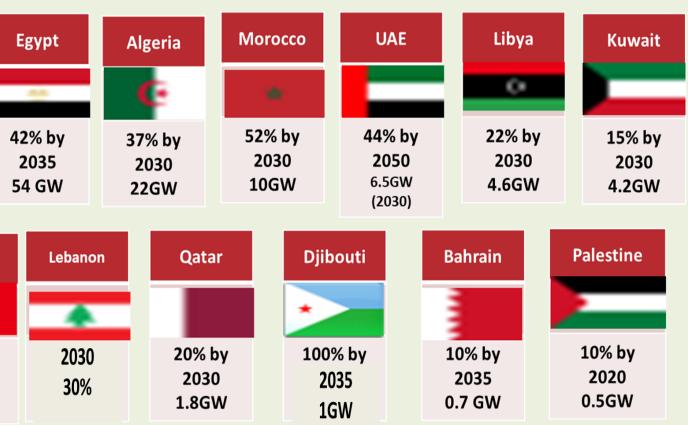

At least 300,000 estimated direct green jobs in Arab countries by 2030

Facing Challenges (1/2)

- MENA countries are considered amongst the most exposed and least resilient to the EU Carbon Border **Adjustment Mechanism.**
- The EU's Carbon Border Adjustment Mechanism could cut the profits from exports of some targeted goods by 10-65%, impacting the producers of these goods.
- This could encourage increased production of H₂-derived materials to reduce the carbon footprint of energyintensive materials exported to Europe.

- salt water.
- Liquid hydrogen transport is costly, while liquid organic hydrogen carrier's gravimetric density is relatively low and the supply chain is complicated.
- Thus, the ammonia and alternative fuels value chain appears the most practical and cost-• effective approach to trade and transport MENA hydrogen over long distances, and this is the approach being pursued by KSA, Egypt and Morocco.

Water electrolyzers currently have an efficiency of 60-81% and require around **9 liters of water to produce 1 kgH**₂.

The cost of water is less than 2% in the overall business case.

Freshwater access may become an issue in water-scarce or water-stressed areas, meaning desalinated seawater will likely be required in the Gulf.

Current electrolyzers require desalinated water, though new generations are under development that could work with

Facing Challenges (2/2)

- Given the early stage of the industry, Arab countries should consider
 - including green (blue) hydrogen in the revision of national sustainable energy strategies and action plans as well as in the Nationally Determined Contributions (NDCs) for the **Paris Agreement**
 - adopting supportive policy instruments and awarenesslacksquarebuilding, starting with policy-making constituency
 - building collaboration on technologies •
 - coordination on harmonizing regulations and standards, •
 - developing low-carbon green products pricing/carbon • pricing mechanisms, with links to other "carbon" pricing schemes (e.g. European ETS), to create business opportunities to expand the hydrogen market.
- Green hydrogen investors need to start by initiating and developing projects themselves, in partnership with state actors and strategic investment vehicles.

More R&D investments need to be allocated to:

- strengthen technology expertise, ullet
- drive cost reductions in electrolyzers,
- create an infrastructure network, and ullet
- refine export business models.
- **Examples of policy instruments:**
 - **Double auction model for green hydrogen supply** contracts (cover for the difference between green H₂ production price and the highest willingness to pay for it)
 - **Carbon contracts for difference in industry;**
 - **Quota for aviation;**
 - **Auctions for CHP plants;**
 - **Financial and fiscal incentives for decarbonized** materials;
- This should be accompanied by <u>regulations</u> that
 - sustainable renewables growth,
 - appropriate infrastructure investment,
 - system integration,
 - standards, certification ...

Final Messages

- economically rewarding
- strong public utilities- private partnerships and incentives.
- renewable technologies
- and acquisitions, etc.)

• New power sector normal is revealed, where RE&EE are increasingly competitive, and the **alternative opportunity** for oil and gas exports and/or utilization in petrochemical industries are financially and

Lowest wind and PV price records are now found in Arab countries, thanks to a well-designed competitive bidding and auctions schemes with

• Economics – rather than policy – will drive accelerated deployment of

Blended energy financing is becoming a mainstream (grants,

soft/concessional/commercial loans, guarantees, and technical assistance, green bonds, sukuk, sovereign and pension funds, early-stage corporate finance, roll-out of phase of new build asset finance, and non-new investments such as corporate merge and acquisition, project equity buyouts, investors exits and asset refinancing

الاقليمي للطاقة المتحددة وكفاءة الطاقة

Conclusions

- into the region in support of clean energy.
- on national, regional and international levels is indispensable.
- solutions and commercializing emerging technologies
- more innovative approaches.

The ambitions to increase the RE share are challenged by the relatively weak pipeline of bankable projects and limited international financial flows

Multi-stakeholders, multi-governance approaches are needed to achieve a radical progress for RE&EE in the post-Covid green recovery and sustainable development agenda. The collaboration among different actors

It is important to capture the immense value of the sustainable energy business and effective public-private partnerships, especially for higher local content through local manufacturing, scaling-up decentralized

To help advancing with the ecosystem, a carful design of the enabling frameworks, legal, regulatory, tariff, contractual and other supplementary frameworks is needed. <u>Fragile and conflict-affected contexts</u> will need

Thank You
